

Summary exercise #1

Knowledge required:

- Select & From clauses
- Filter & Sort (Where & order by clauses)
- Scalar functions
- Conversion functions
- Aggregate & analytic functions
- Union, intersect, except
- Subquery

“Pokemon” table:

1. Present all the pokemons with the letter R in their name.
2. Order all the pokemons by their weight in descending order.
3. Present the pokemons’ names in lowercase.
4. Count the number of pokemons that are taller than 70.

“DsOne_orders” table:

1. For all the orders in the “Office Supplies” category that shipped in 2019, calculate the average number of days to ship.
2. For all the orders placed on Monday, calculate the average length of the products’ names.
3. Which city has the largest total sales amount? Present the city, the sales amount, and the state.
4. Find the state with the highest number of customers whose names include the letter "C". Then, within that state, figure out how many customers with the letter "C" in their names live in each city. Do this using only one query.

“data_auto” tables:

1. November table - What is the total cost of Ferrari ads placed on Sunday?
2. Union both of the tables (October & November) - once with “union all”, once with “union”. Is there a difference between both queries? What does it mean?
3. Without performing a query - Using the conclusions from section 2, if we perform “intersect” between the 2 tables, what will be the result?
